

26th International Lab Meeting – Winter Session 2015 25th – 28th January 2015, Rome (Italy)

Key Lecture

Advanced Training in the meta-theoretical analysis
of the specialised literature on
Social Representations and Communication

European/International Joint Ph.D.
in Social Representations and Communication

An introduction to Scopus and bibliometrics

Alberto Zigoni

Senior Consultant, Research Intelligence

a.zigoni@elsevier.com

Rome, 26 January 2015

Agenda

- Scopus
 - Overview
 - Content Coverage
 - Content Selection Criteria
 - Author and Affiliation profiles
- Bibliometrics
 - Basic concepts
 - Use cases and applications
 - Journal Indicators
 - Alternative metrics

Scopus at-a-glance

The largest abstract and citation database of peer-reviewed research literature from around the world

More than 21,900 titles from more than 5,000 international publishers and 105 different countries

Over 55 million records, 23 million patents from 5 patent offices worldwide

All content is vigorously vetted by an independent, 15-person, international board of experts called the Content Selection and Advisory Board (CSAB)

How Scopus supports the researcher

Scopus is for academics, government researchers and corporate R&D professionals who need a comprehensive and efficient place to search, discover and analyze research:

- Find out what already exists in the global world of research output
- Determine how to differentiate research topics and find new ideas
- Decide what, where and with whom to partner or collaborate with
- Track impact of research; monitor global research trends
- Identify and analyze which journals to read or where to submit an article
- Help researchers manage their career through citation counts and the *h*-index

How Scopus supports the research manager

Scopus is the most comprehensive data source of scientific peer-reviewed literature and as such it can be used as a database for bibliometric analyses on the research activity of entities such as countries, institutions, researchers:

- Measure the scientific production of entities and its trend over time.
- Assess the scientific impact as captured by citations
- Analyze collaboration networks
- Evaluate the performance of research units
- Inform a publishing strategy to maximize the visibility and impact of scientific outputs.

What content is in Scopus?

How much content does Scopus include?

Over 55M records from **21,912** serial titles and **42,000** books (July 2014)

22M pre 1996 records | 33.0M post 1995 records

- Content from > 5,000 publishers
- “Articles in Press” from > 3,750 titles
- Titles from 105 different countries in all geographical regions
- 40 “local” languages covered
- More than 2,800 Gold Open Access journals indexed

Scopus is ideal compared to other products because it has the broadest coverage of global, curated, relevant research, with smart, simple tools to help track, analyze and visualize research.

What content does Scopus include?

Physical Sciences
6,600

Health Sciences
6,300

Social Sciences
6,350

Life Sciences
4,050

JOURNALS

21,912 peer-reviewed journals
367 trade journals

- Full metadata, abstracts and cited references (pre-1996)
- >2,800 fully Open Access titles
- Going back to 1823
- Funding data from acknowledgements

CONFERENCES

17k events
5.5M records (10%)

Conf. expansion:
1,000 conferences
6,000 conf. events
400k conf. papers
5M citations

Mainly Engineering and Physical Sciences

BOOKS

421 book series
- **28K** Volumes
- 925K items

29,917 books
- 311K items

Books expansion:
75K books by 2015
- Focus on Social Sciences and A&H

PATENTS

24M patents
from 5 major patent offices

All Science Journals Classification

- **4 domains**
 - Physical Sciences
 - Life Sciences
 - Health Sciences
 - Social Sciences and Humanities
- **27 subject areas**
- **334 subject fields**
- **Multidisciplinary journals (e.g. Nature, Science) are grouped under the “General” category (top level)**

Scopus covers different source types for a reason

JOURNALS

- Timely
- Peer-reviewed (formal research)

All subject fields, but typical fields with high ratio of journal publication: chemical, biological, health sciences etc.

CONFERENCES

- Preliminary research (can be a bit less formal)
- Newer ideas

Mainly of importance in Computer Science and Engineering-related subject fields

BOOKS

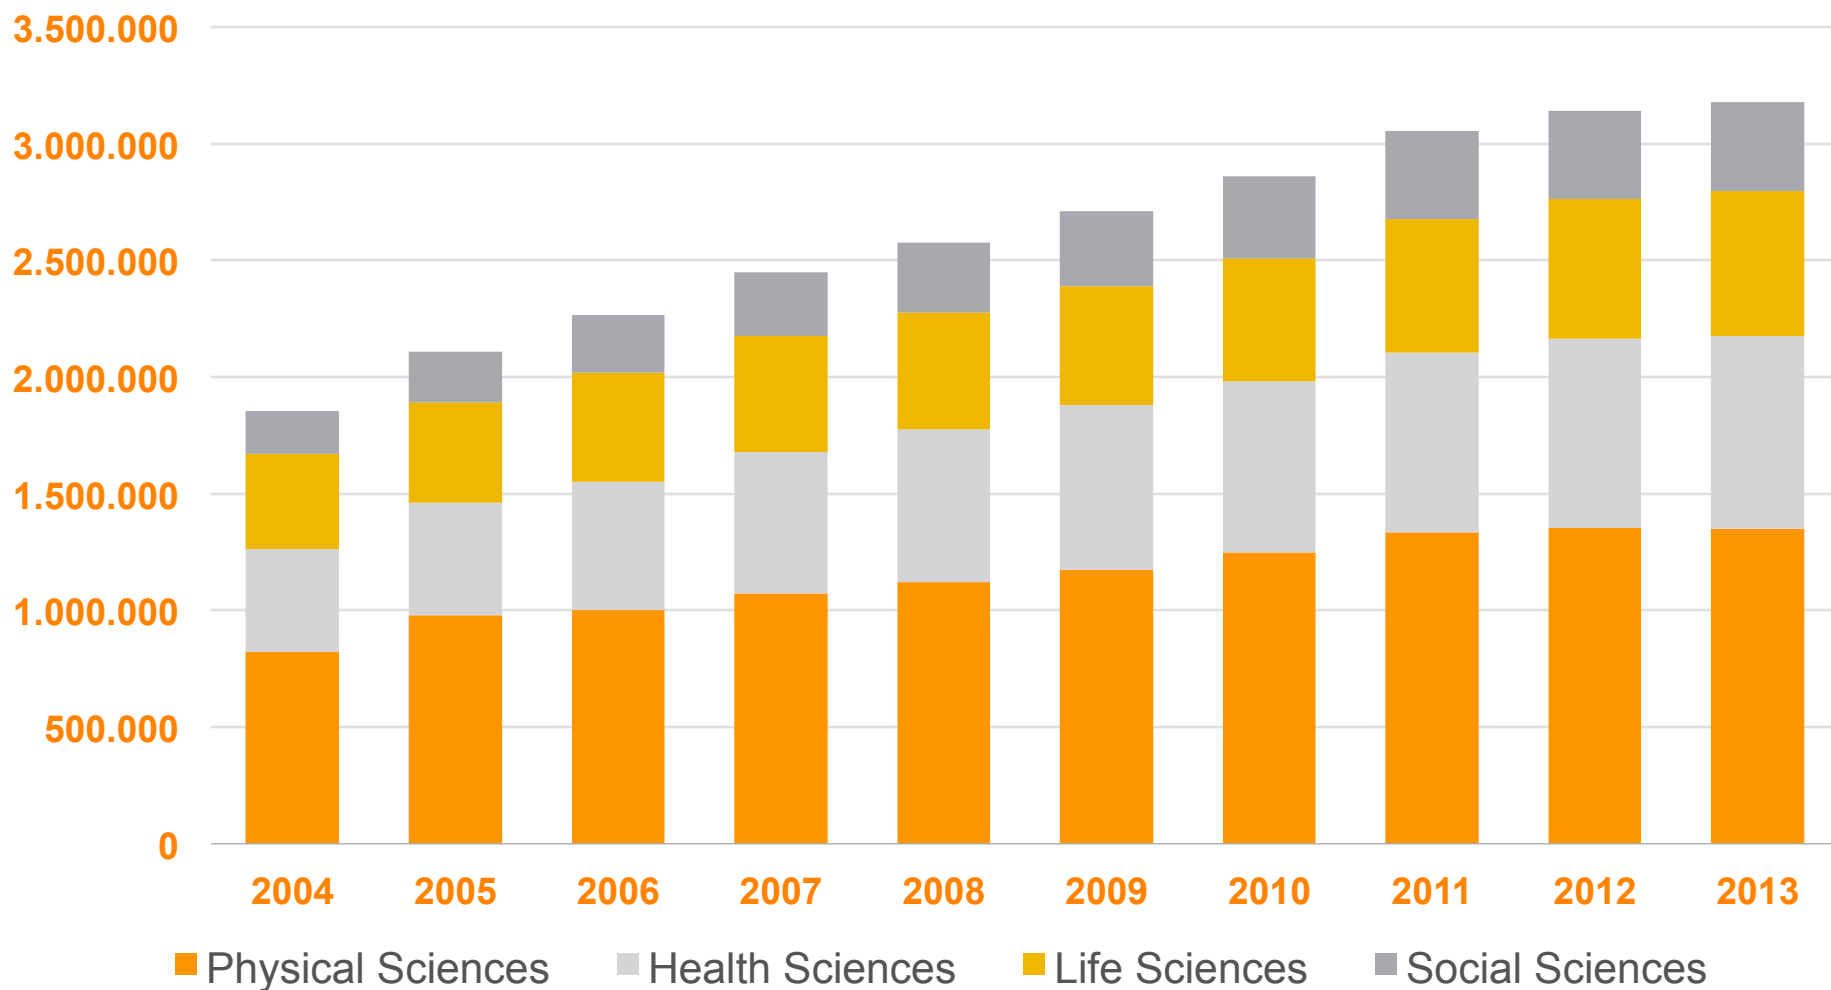

- Thorough analysis of a specific topic

Mainly of importance in Social Sciences and the Arts & Humanities

Different source types are added to ensure that coverage, discoverability, profiles and impact measurement for research in all subject fields is accounted for in Scopus.

Scopus article growth over years

Ratio of journals per Publisher in Scopus

Source: Scopus title list (May 2014)

How does Scopus choose content?

All titles should meet all minimum criteria in order to be considered for Scopus review:

Peer-review

English
abstracts

Regular
publication

Roman script
references

Pub. ethics
statement

Eligible titles are reviewed by the Content Selection & Advisory Board according to a combination of 14 quantitative and qualitative selection criteria:

Journal Policy	Quality of Content	Journal Standing	Regularity	Online Availability
<ul style="list-style-type: none"> • Convincing editorial concept/policy • Type of peer-review • Diversity geographic distribution of editors • Diversity geographic distribution of authors 	<ul style="list-style-type: none"> • Academic contribution to the field • Clarity of abstracts • Quality and conformity with stated aims & scope • Readability of articles 	<ul style="list-style-type: none"> • Citedness of journal articles in Scopus • Editor standing 	<ul style="list-style-type: none"> • No delay in publication schedule 	<ul style="list-style-type: none"> • Content available online • English-language journal home page • Quality of home page

Info: <http://www.elsevier.com/online-tools/scopus/content-overview>

Questions: titlesuggestion@scopus.com

More on the CSAB...

Titles are selected by the independent Content Selection & Advisory Board (CSAB)

Focus on quality through content selection by the independent CSAB, because:

- Provide accurate and relevant search results for users
- No dilution of search results by irrelevant or low quality content
- Support that Scopus is recognized as authoritative
- Support confidence that Scopus “reflects the truth”

Scopus title review results and resources

In total 3,914 titles reviewed (2011 –2013) of which 1,844 (47%) accepted for Scopus

Titles reviewed top 20 countries (2013):

As a primary publisher and information aggregator, Elsevier understands the unique needs of *Authors*, *Editors* and *Publishers* and provides resources to support the research community:

- **Advice from CSAB** and FAQs available on Scopus info site
- **Publication ethics** resources via Publishing Ethics Resource Kit (PERK) and Committee on Publication Ethics (COPE)
- Translation, editing and **publishing services**
- Elsevier.com **Editors section** (for ELS editors but applicable to all)
- Freely available **journal metrics** to compare & assess journal performance
- Trends in research via **Research Trends** newsletter

Selection of non-serial Book and Conference content

Books

Book selection is via a publisher-based approach (no individual suggestions accepted). All books from selected publishers deemed “in scope” will be selected for coverage. Priority and selection of publisher’s book lists depends on:

- Reputation and impact of the publisher
- Size and subject area of the books list
- Availability and format of the book content
- Publication policy and editorial mission
- Quality of published book content

Conferences

Engineering related conferences 2005 going forward included on various vetted lists (no individual suggestions accepted).

- Australian Research Council: ARC-A, ARC-B
- “MIT” Conferences
- DBLP Computer Science Bibliography (orig. db logic program bibliography)
- Microsoft Academic Science – Computer Science, Engineering
- INSPIRES – high-energy physics (Stanford)
- Web of Science – selected engineering-focused/related
- OnePetro – Oil & Gas industries (society conferences from API, SPE, NACE, SEG, etc.)
- OneMine – mining and minerals (society conferences from SME, TMS, AIME, AusIMM, ...)

What content expansion projects are ongoing?

Scopus has three main content expansion programs

1. Books Enhancement, started June 2013
2. Conference Expansion, started 2011
3. Cited References Expansion (back file), started March 2014

Books expansion program

- ☐ Book Chapter (268,335) >
 - ☐ Book (30,151) >
- (plus ~28K book Volumes from series)

Coverage years

- Back to 2005 (2003 for A&H)

Number of books

- 75,000 over three years; 10,000 each year thereafter

Book types

- Monographs, edited volumes, major reference works, graduate level text books

Handbook of Psycholinguistics

2006, Pages 659-724

Elsevier, Springer, Wiley, Brill, De Gruyter, Woodhead, Karger, Edward Elgar, Maney, Intellect, IOS Press, Pan Stanford, University of California Press, Princeton University Press, Edinburgh University Press, Delft University Press, Duke University Press, McGill Queens University Press, Project Muse (60+ UPs), OECD and more...

Conference expansion – project status

	Oct 2013 status	June 2014
Conference titles	704	1,000
Conference events	3,675	5,600 – 6,000
Conference papers	250,000	375,000 – 400,000
References*	3.3 Million	4.95 Million – 5.28 Million

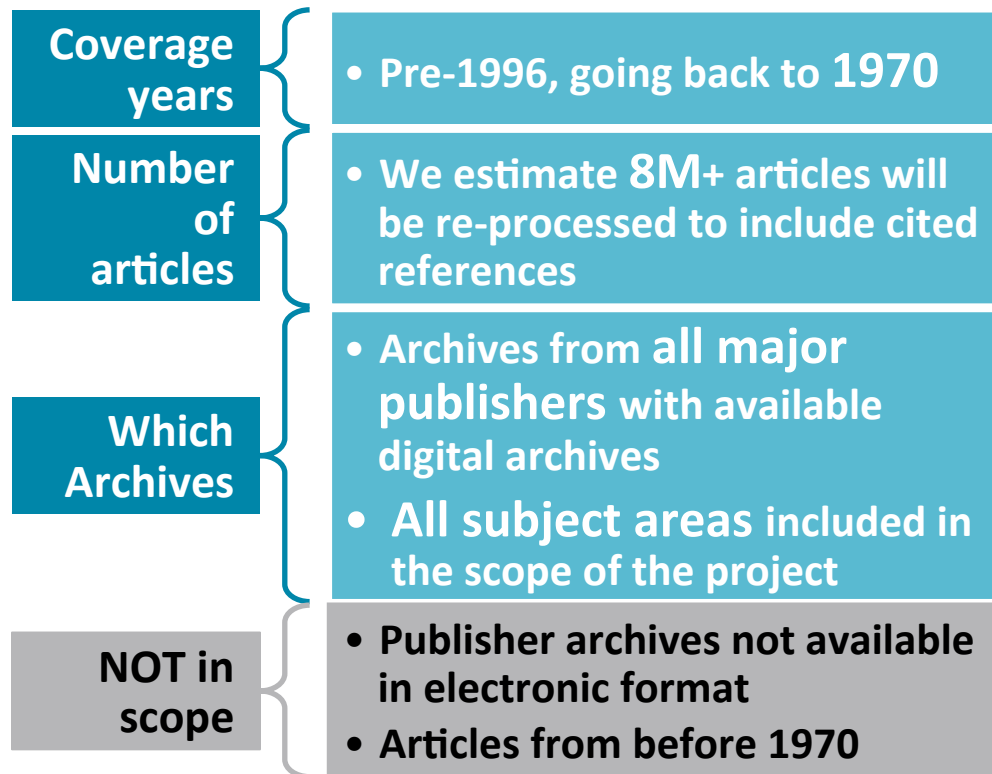

*References added to Scopus Citations cover period 2005 to present

Scopus cited references expansion program

Scopus will add cited references to 8 Million pre-1996 articles going back to 1970.

Scope and timeline

With the Scopus Cited References Expansion project we aim to **add cited references** to the articles in Scopus from before 1996, going back to 1970.

In addition, for publishers from which we currently miss pre-1996 content, the **archives will be added** to Scopus.

All added content is included in the **standard Scopus license at no extra charge.**

Development of required systems and processes has already started

The first content with pre-1996 cited references will be visible in Q4 2014 (Elsevier & Springer)

Project will be completed by 2016 when >8M articles from all major publishers have been loaded

Self-assembled two-dimensional protein arrays in bionanotechnology: From S-layers to designed lattices (Review)

Baneyx, F. , Mattheaei, J.F. 

Department of Chemical Engineering, University of Washington, Box 351750, Seattle, WA 98195-1750, United States

Abstract

[View references \(49\)](#)

Although the crystalline S-layer arrays that form the exoskeleton of many archaea and bacteria have been studied for decades, a long-awaited crystal structure coupled with a growing understanding of the S-layer assembly process are injecting new excitement in the field. The trend is amplified by computational strategies that allow for in silico design of protein building blocks capable of self-assembling into 2D lattices and other prescribed quaternary structures. We review these and other recent developments toward achieving unparalleled control over the geometry, chemistry and function of protein-based 2D objects from the nanoscale to the mesoscale. © 2013 Elsevier Ltd.

Indexed keywords

Assembly process; Bionanotechnology; Building block; Computational strategy; Protein arrays; Quaternary structure; Self-assembled; Self-assembly

Engineering controlled terms: Biotechnology

Engineering main heading: Proteins

EMTREE drug terms: ampholyte; nanomaterial; nanoparticle

EMTREE medical terms: archaeon; bacterium; binding affinity; binding site; computer analysis; computer model; crystal structure; Deinococcus radiodurans; Escherichia coli; exoskeleton; Geobacillus stearothermophilus; geometry; nanoanalysis; nanobiotechnology; nonhuman; physical chemistry; priority journal; process design; process development; protein assembly; protein engineering; protein function; protein microarray; protein quaternary structure; proton transport; review; Sporosarcina ureae; structure activity relation; two dimensional protein array; ultrafiltration

DOI: 10.1016/j.copbio.2013.11.001 Document Type: Review

Funding Details

Number; Acronym; Sponsor: T32CA138312; ONR; Office of Naval Research
Number; Acronym; Sponsor: BRC-11123566; NIH; **National** Institutes of Health

WHAT FUNDING DATA:

- **Full name** of the funding body, **acronym** and **grant number** captured from the acknowledgments section of the article.
- Making use of the **FundRef** ontology
- **Forward flow**, started in July 2013

FUNDREF ONTOLOGY:

- Only funding bodies included in the FundRef ontology are captured
- Around **5,000 funding bodies** originally included in FundRef
- When processing content for Scopus new funding body terms are identified as **candidate terms**
- As of January 2014 around **1,000 new candidate terms** will be added to FundRef each month

In Scopus funding data can be searched using the following fields in Advanced Search:

FUND-SPONSOR | FUND-ACR | FUND-NO

For example, the advanced search term “[FUND-SPONSOR\(National Science Foundation\)](#)” will result in all articles that mention the National Science Foundation as the funding body in the acknowledgements.

Bibliometrics

Definitions

Bibliometrics is the application of statistical methods to books and other media of communication (Pritchard, 1969)

Scientometrics is the “science of science” i.e. the study of the structure and dynamics of scientific and innovation systems.

When applied to scientific publications, bibliometrics can be seen as a sub-field of scientometrics, focusing on one class of outputs of a scientific system.

Bibliometric analyses are usually carried out using abstract and citations databases such as Scopus as underlying data sources.

A framework for the analysis of a scientific system

Inputs

Funding

Human Capital

Infrastructures

Throughputs

Collaboration

Brain circulation

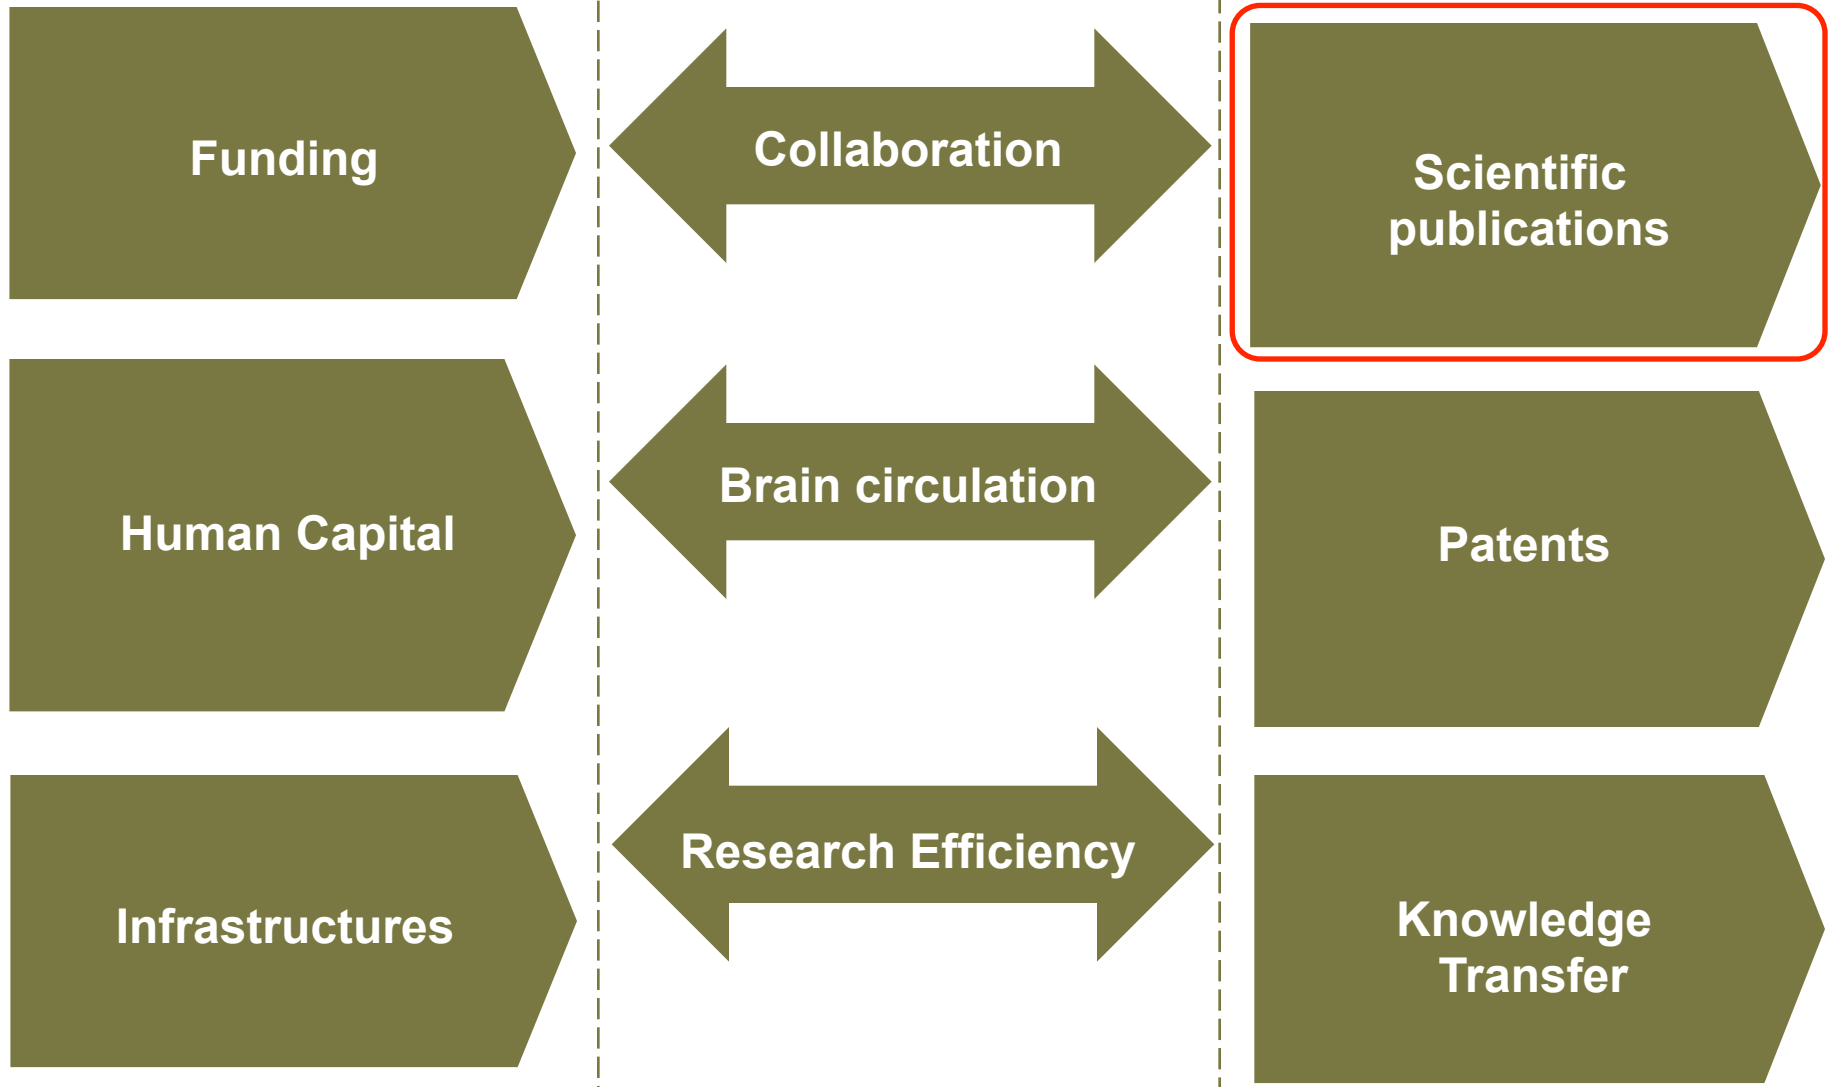

Research Efficiency

Outputs/outcomes

**Scientific
publications**

Patents

**Knowledge
Transfer**

Metadata used in a bibliometric analysis

- Type of publication (Original Research Article, Review, Conference paper...)
- Journal identifier
- Journal classification
- Publication year
- Author names (co-authorship networks)
- Affiliations (collaboration analyses)
- Number of citations (impact)
- Cited references (citation networks)
- Title / abstract / keywords (for text mining purposes)
- Acknowledgements (funding information)

WHO to measure

Bibliometric analyses are done on “entities” that are represented by a dataset of publications.

One common way to define a dataset is to look at the scientific production of a physical entity

- Country or group of countries
- Institution or group of institutions
- Researchers or groups thereof

Other entities don't represent an individual research performer

- Journals
- Publications corpora that represent a specific research topic

WHAT to measure

Production

Scientific Impact and Recognition

Global outreach

Publications prestige

Collaboration networks

Knowledge transfer (cross-sector collaboration)

Research trends (keywords analysis)

HOW to measure

Raw indicators

- Number of publications
- Number of authors
- Number of citations
- Number and types of collaboration

Derived indicators / normalized indicators

- Fractionalized count of papers
- Average number of papers per researcher
- Citations per publication
- Field-Weighted Citation Impact (FWCI)
- Impact ranking of publications with citation percentiles
- H-index
- Impact Factor
- SNIP
- SJR

Dimensions of analysis

- Time (publication year / citation year)
- Subject field (e.g. ASJC)

WHERE to measure: bibliographic databases

ISI Web of Science

- <http://thomsonreuters.com/thomson-reuters-web-of-science/>

Elsevier Scopus

- <http://www.elsevier.com/online-tools/scopus>

Google Scholar

- <http://scholar.google.com>

Some basic rules

Indicators should be chosen based on the question being answered

Multiple indicators always provide more information than a single number

Not all indicators are suitable for all entities, e.g.: h-index applies only to researchers, SNIP to journals, etc.

When benchmarking entities of different nature, it is important to be aware of normalized indicators, where normalization can be done by several dimensions:

- Size
- Time
- Discipline
- Document type

Evolution of Scopus Analysis Tools

Journal Metrics in Scopus: SNIP & SJR

Universiteit Leiden

SNIP

- SNIP=Sourced Normalized Impact per Paper
- Refined metric calculation, **better corrects for field differences**
- Outlier scores are closer to average

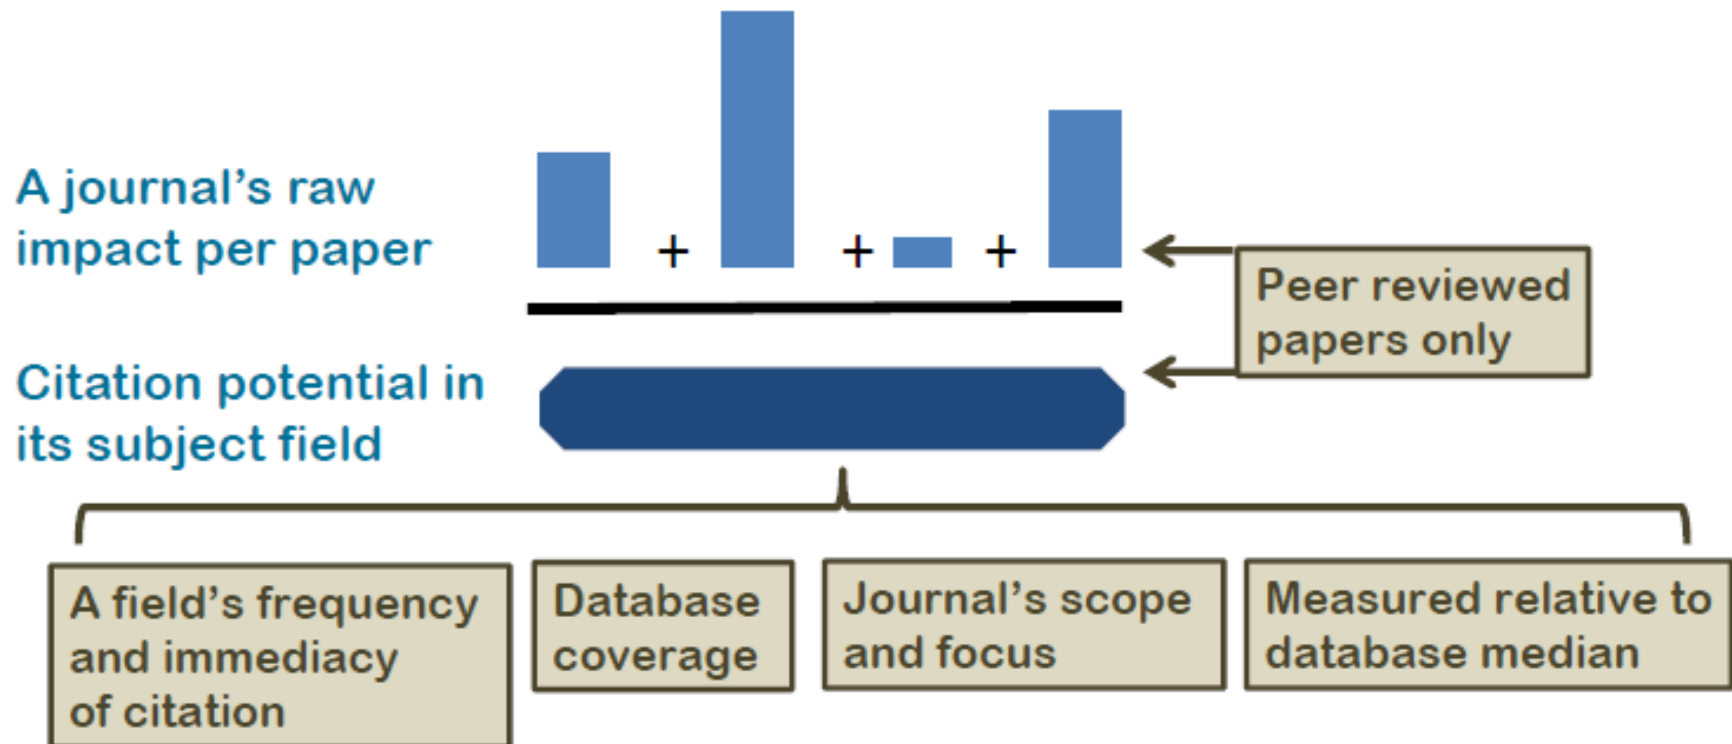

www.journalmetrics.com

SJR

SCIMAGO
L A B

- SJR=SCImago Journal Rank
- More prestigious nature of citations that come from within the same, or a closely related field
- **Overcome the tendency for prestige scores to decrease as the quantity of journals increases**

Source Normalized Impact per Paper (SNIP)

SJR - SCImago Journal Rank

Prestige metric: Prestige transferred when a journal cites

- Citations are weighted depending on where they come from
- A journal's prestige is shared equally between its citations

High impact, lots of citations
One citation = low value

Low impact, few on citations
One citation = high value

SJR normalises for differences in citation behaviour between subject fields
